PROFESSIONAL SUMMARY

Finance and controls professional with 3+ years at Wells Fargo, specializing in regulatory controls, data governance, and audit-ready validation. Translates regulatory requirements into traceable data lineage, control evidence, and operating workflows for BCBS 239, CCAR, and CECL reporting. Pairs root-cause analysis and workflow measurement with AI-enabled process design to improve turnaround time, throughput, and analyst capacity. Combines finance domain knowledge with hands-on Python, SQL, workflow automation, and documentation practices to bridge business controls and technical execution. Independently builds evaluation methods for LLM-based decision systems, focused on faithful behavior, adversarial robustness, and reproducible evidence for high-stakes finance applications.

PROFESSIONAL EXPERIENCE

WELLS FARGO - Finance Analyst

Bangalore, India | Jul 2023 - Present | Promoted from Associate within 1.8 years | 3x Spotlight Awards

Regulatory Validation

- Produced audit-ready lineage documentation covering 5+ reporting domains across BCBS 239 reporting.
- Validated data inputs and source-to-report lineage for CCAR and CECL exercises across Wealth Management portfolios.
- Remediated recurring control failures through root-cause analysis, reducing recurrence by approximately 25% over two quarters.
- Analyzed 200+ workflow metrics to identify reporting-cycle efficiency gains and support approximately 30% improvement in throughput.

AI-enabled Process Engineering

- Designed multi-layer prompt architecture with discipline, technical, and validation layers for regulatory report workflows.
- Directed development of Python-based extraction tool parsing regulatory reports into UCDD format, reducing turnaround by 60%.
- Deployed two AI-assisted workflow tools in active team use, recovering approximately 425 analyst-hours annually.

INDEPENDENT RESEARCH & VALIDATION

Counterfactual Ablation - Agent Faithfulness Method

- **Objective:** Evaluate whether episodic memory causally changes LLM decision policies.
- **Method:** Developed counterfactual ablation framework removing retrieved memories while holding all other inputs constant.
- **Method:** Built deterministic evaluation pipeline using structured outputs, adversarial baselines, and statistical testing.
- **Current work:** Investigating how memory representation and instruction hierarchy influence autonomous decision-making.

Keel - Agentic Trading Workflow

- Designed agentic workflow integrating signal generation, execution, validation, human override, and performance attribution.
- Built attribution ledger separating AI-generated actions from human intervention during live trading.
- Verified execution constraints against exchange records and identified deployment risks before autonomous operation.

TPAAM - Regime-aware Allocation Framework

- Designed probabilistic regime detection framework for market-regime classification and allocation testing.
- Developed adversarial validation using synthetic market noise to test whether the framework invented false signals.
- Pre-registered evaluation criteria before experimentation, including tie-breaking rules favoring the simpler baseline.
- Documented failure modes alongside successful outcomes to separate proven findings from open hypotheses.

TECHNICAL SKILLS

Validation: Counterfactual Ablation | Adversarial Testing | Model Validation | Statistical Testing | Backtesting | Independent Challenge

AI: LLM Evaluation | Agentic Workflows | Prompt Engineering | Python | SQLite | Ollama | Git

Finance: BCBS 239 | CCAR | CECL | Regulatory Controls | Data Lineage | Audit Documentation

Analytics: SQL | Power BI | Tableau | Alteryx

EDUCATION

MBA - Christ University, Bangalore (7.51), 2023

B.Tech, Mechanical Engineering - Mahindra University, Hyderabad (7.26), 2021
